Who Worked When

Why manual time sheets or punch clocks may not be good for your business!

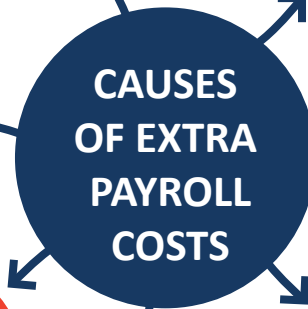

Here are some of the common issues we have seen in the 25-years we have helped businesses improve their payroll processes. This has been backed up by International Research:

“Time Creep” (employees recording start and finish times in their favour, long lunches and breaks, tardiness, early departures, etc.)
The average weekly time creep (some people use the term **Time Theft**) was up to **4 hours per employee!**

“Calculation Creep” It was found that the calculation and/or keying error rate was **up to 8%** of total payroll in companies that use time sheets.

“Buddy Punching” The average loss as a result of clocking in for each other or completing each other’s time sheet was **between 2-5%**.

“Hidden Admin Costs” The study showed that manual calculation and keying of time sheets takes approximately 5 minutes per time sheet.

“New systems cost money” While this may be true, what are the costs of not changing? Research indicates manual attendance systems can add up to 5% to your annual wage bill.

“This doesn’t apply to us” The most telling finding was that most employers who experienced these issues were not aware they had a problem.

“We’ve always done it this way” This is not a business strategy. If you don’t compare your current method to the alternatives you will never find out if there is a better way.

TimeHub is a powerfully simple time & attendance system which eliminates these issues.

Talk to us today about taking “time” out of managing your payroll.
